Geno Borja is presenting

### Predicting Lighting Results In Design

When designing lighting, designers must make sure to have the proper amount of light. How many luminaires? How many watts? Which lamp type? It must be kept in mind that the acceptable light level ranges from about two thirds to four thirds of the target. This is the technical part of lighting design that frustrates many architects and interior designers.

- The quantities used to characterize light physically are *Radiometric*.
- The human eye responds to roughly 380 nm to 780 nm wavelengths.
- The quantities used to characterize how light is perceived by humans are *Photometric*.
